

The classic endurance runner up to 30MPa

Excellent wear resistance on (virtually) all shafts

iglidur® W300

When to use it?

- When especially high service life is necessary
- When low coefficient of dynamic friction and high wear resistance are required
- For use on 304 stainless steel shafts
- For harsh environments and rough shafts
- Dirt-resistant

When not to use?

- For high loads starting at 50MPa iglidur® Q
- When continuous operating temperatures are higher than +90°C iglidur® H, iglidur® X
- For very wet environments iglidur® P
- When a cost-effective plain bearing is required iglidur[®] G

-40°C up to +90°C

60MPa

Bearing technology | Plain bearing | iglidur® W300

Of all iglidur® materials, iglidur® W300 is the most resistant to these conditions.

Over 400 sizes available from stock

Suitable for applications with soft shafts

Test engineering and quality assurance

Descriptive technical specifications

Wear resistance at +23°C

Wear resistance at +90°C

Wear resistance at +150°C

Low coefficient of friction

Low moisture absorption

High media resistance

Resistant to dirt

Wear resistance under water

Resistant to edge pressures Suitable for shock and impact loads

 Very long service life Low coefficient of friction

Very wear-resistant

Typical application areas

 Lubrication-free Maintenance-free

Automation

Printing industry

Woodworking

Mechatronics

Excellent wear resistance on (virtually) all shafts

iglidur® W300 gives excellent wear resistance, even in harsh environments or when used with rough shafts.

Surface resistance	Ω	> 1012	DIN 53482

iglidur® W300 gives excellent wear resistance, even in harsh environments or when used with rough shafts. This material is the most tolerant of these external effects out of all the iglidur® range.

Moisture absorption

Under standard climatic conditions, the moisture absorption of iglidur® W300 plain bearings is approximately 1.3% weight. The saturation limit in water is 6.5% weight. This must be taken into account for these types of applications.

Vacuum

In vacuum, any present moisture is released as vapour. The use in vacuum is only possible to a limited extent.

Radiation resistance

Plain bearings made from iglidur® W300 are resistant up to a radiation intensity of 3 · 10²Gy.

Resistance to weathering

iglidur® W300 plain bearings have limited resistance to weathering. The material properties are affected. Discoloration occurs. Practical tests under real application conditions are recommended.

Mechanical properties

With increasing temperatures, the compressive strength of iglidur® W300 plain bearings decreases. Diagram 02 shows this inverse relationship. The maximum recommended surface pressure is a mechanical material parameter. No conclusions regarding the tribological properties can be drawn from this.

iglidur® W300 presents a very high compressive strength in spite of its high elasticity. Diagram 03 shows the elastic deformation of iglidur® W300 at radial loads. At the maximum recommended surface pressure of 60MPa the deformation is less than 3%.

Surface pressure, page 41

Permissible surface speeds

Even at higher surface speeds, the coefficient of friction of iglidur® W300 plain bearings remains the same. In relation to other materials, somewhat higher surface speeds can be attained, for example, up to 1.5m/s rotating and up to 6.0m/s linear. The wear remains low when used for long periods at high speeds, due to exceptional wear resistance. Relatively high speeds can be obtained with iglidur® W300 bearings on hardened shafts with the recommended surface finish.

Surface speed, page 44

Temperature

iglidur® W300 plain bearings retain their exceptional wear resistance even up to the highest permissible application temperatures and at the same time resist becoming brittle at low temperatures. For temperatures over +60°C an additional securing is required.

Application temperatures, page 49 Additional securing, page 49

Friction and wear

Similar to wear resistance, the coefficient of friction µ also changes with the load. In contrast to other iglidur® materials, the coefficient of friction of iglidur® W300 remains consistently low at higher rotational speeds.

Coefficient of friction and surfaces, page 47 Wear resistance, page 50

Shaft materials

The friction and wear are also dependent, to a large degree, on the shaft material. Shafts that are too smooth, increase both the coefficient of friction and the wear of the bearing. Smooth shafts have the danger of stick slip. Squeaking as an effect of stick slip is usually the result of shafts that are too smooth. Shaft surface finish of 0.4 -0.5um have proven to be the best. For iglidur® W300, the wear resistance is still excellent with this surface finish as the friction adopts the minimum value. Diagram 06 shows results of testing different shafts. Hardened shafts are preferred for applications for higher loads. If the shaft material you plan on using is not shown in these test results, please contact us.

Shaft materials, page 52

Installation tolerances

iglidur® W300 plain bearings are standard bearings for shafts with h tolerance (recommended minimum h9). The bearings are designed for press-fit into a housing machined to a H7 tolerance. After being assembled into a nominal size housing, in standard cases the inner diameter automatically adjusts to the E10 tolerances. For particular dimensions the tolerance differs depending on the wall thickness (please see product range table).
